

Plantex® Platinum combats Japanese knotweed in Weespersluispark.

A new neighbourhood

Weespersluis is a new neighbourhood, centrally located 10 train minutes from Amsterdam, close to t'Gooi and near the Vecht. Nature and water play an important role; only part of the area is built on, leaving the rest open to water and nature. The three parks in the neighbourhood provide space for safe playing, sports, walking and cycling.

Japanese knotweed in Weespersluis park

During the construction of the parks, Weespersluis faced a challenge: Japanese knotweed was found at the location where Weespersluispark is planned.

Covering with Plantex® Platinum

To prevent Japanese knotweed from causing damage to the park, the decision was made to pack the area with Plantex® Platinum.

The good water and air permeability of this material ensures that the park can be built on top of the packed area. This is because the soil under the material remains healthy.

A layer of clean soil on top of Plantex® Platinum is required and will be used to transform the Weespersluis Park into a real green city garden!
